Note : Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid (Art. 99(1) European patent convention).

## Description

This invention relates to a receiving element which is used with a donor element containing a 6-coordinate europium(III) complex to form a higher coordinate complex.

In recent years, thermal transfer systems have been developed to obtain prints from pictures which have been generated electronically from a color video camera. According to one way of obtaining such prints, an electronic picture is first subjected to color separation by color filters. The respective color-separated images are then converted into electrical signals. These signals are then operated on to produce cyan, magenta and yellow electrical signals. These signals are then transmitted to a thermal printer. To obtain the print, a cyan, magenta or yellow dye-donor element is placed face-to-face with a dye-receiving element. The two are then inserted between a thermal printing head and a platen roller. A line-type thermal printing head is used to apply heat from the back of the dye-donor sheet. The thermal printing head has many heating elements and is heated up sequentially in response to the cyan, magenta and yellow signals. The process is then repeated for the other two colors. A color hard copy is thus obtained which corresponds to the original picture viewed on a screen. Further details of this process and an apparatus for carrying it out are contained in U.S. Patent No. 4,621,271 by Brownstein entitled "Apparatus and Method For Controlling A Thermal Printer Apparatus," issued November 4, 1986.

The system described above has been used to obtain visible dye images. However, for security purposes, to inhibit forgeries or duplication, or to encode confidential information, it would be advantageous to create non-visual ultraviolet absorbing images that fluoresce with visible emission when illuminated with ultraviolet light.

U.S. Patents 4,876,237, 4,871,714, 4,876,234, 4,866,025, 4,860,027, 4,891,351, and 4,891,352 all relate to thermally-transferable fluorescent materials used in a continuous tone system. However, none of those materials fluoresce a visible red color when illuminated with ultraviolet light, and none of them describe ligands for use in the receiving element. A red color is desirable for many security applications. EP-A-211754 discloses a system wherein a solution of a ligand is applied to a paper impregnated with a Europium (III) salt or vice versa.

U.S. Patent 4,627,997 discloses a fluorescent thermal transfer recording medium comprising a thermally-meltable, wax ink layer. It is an object of this invention to provide a receiving element which contains ligands to react with fluorescent materials transferred from a donor element.

These and other objects are achieved in accordance with this invention which comprises a receiving element for thermal transfer comprising a support having thereon a polymeric image-receiving layer, wherein the image-receiving layer also contains a monodentate or bidentate ligand capable of reacting with a 6-coordinate europium(III) complex to form a higher coordinate complex, the higher coordinate complex which is formed in situ in the receiving layer having the following formula:

wherein: D is substituted or unsubstituted aromatic, 5- or 6-membered carbocyclic or heterocyclic moiety; J is  $-\text{CF}_3$ ,  $-\text{CH}_3$ ,  $-\text{CH}_2\text{F}$  or  $-\text{CHF}_2$ ; and

B represents at least one monodentate ligand with an electron-donating oxygen or nitrogen atom, e.g., tri-n-octylphosphine oxide, pyridine-N-oxide or triphenylphosphine oxide; or at least one bidentate ligand with two electron-donating oxygen, nitrogen or sulfur atoms capable of forming a 5- or 6-membered ring with the europium atom, e.g., 2,2'-bipyridine, 1,10-phenanthroline, ethylene diamine or 1,2-diaminobutane.

In a preferred embodiment of the invention, the 6-coordinate europium(III) complex, which is supplied from a donor element, has the formula:

wherein: D is a substituted or unsubstituted, aromatic, 5- or 6-membered carbocyclic or heterocyclic moiety, e.g., phenyl, 2-thienyl, 2-furyl, 3-pyridyl, etc.; and J is -CF<sub>3</sub>, -CH<sub>3</sub>, -CH<sub>2</sub>F or -CHF<sub>2</sub>.

15 The above fluorescent europium complexes are essentially non-visible, but emit with a unique red hue in the region of 610 to 625 nm when irradiated with 360 nm ultraviolet light. This red hue is highly desirable for security-badging applications.

Europium(III) is the only rare-earth known to be suitable for the practice of the invention. Rare earth metals, including europium, are described in the literature such as S. Nakamura and N. Suzuki, *Polyhedron*, 5, 1805 (1986); T. Taketatsu, *Talanta*, 29, 397 (1982); and H. Brittain, *J.C.S. Dalton*, 1187 (1979).

20 Diketone ligands from which the 6-coordinate complexes are derived include the following within the scope of the invention:

6-Coordinate ComplexDiketone Ligand

Compound 1

Compound 2

Compound 3

Compound 4

Compound 5

Compound 6

Compound 7

Suitable monodentate and bidentate ligands within the scope of the invention for incorporation in the receiving element include:

2,2'-Bipyridine (Kodak Lab. Chemicals  
No. 4397)

1,10-Phenanthroline (Kodak Lab.  
Chemicals No. 3289)

$\text{H}_2\text{NCH}_2\text{CH}_2\text{NH}_2$  Ethylene diamine (Kodak Lab. Chemicals No. 1915)

( $n\text{-C}_8\text{H}_{17}$ )<sub>3</sub>PO      Trioctylphosphine Oxide (Kodak Lab. Chemicals No. 7440)

These emission enhancing ligands are incorporated in the receiver at up to 70 weight percent, preferably 10 to 25 weight percent of the receiving layer polymer. This corresponds to from 0.1 to 10 g/m<sup>2</sup>.

A visible dye can also be used in a separate or the same area of the donor element used with the receiving element of the invention provided it is transferable to the dye-receiving layer by the action of heat. Especially good results have been obtained with sublimable dyes such as:

40 or any of the dyes disclosed in U.S. Patent 4,541,830. The above dyes may be employed singly or in combination to obtain a monochrome. The above image dyes and fluorescent dye may be used at a coverage of from 0.01 to 1 g/m<sup>2</sup>, preferably 0.1 to 0.5 g/m<sup>2</sup>.

The fluorescent material in the above donor element is dispersed in a polymeric binder such as a cellulose derivative, e.g., cellulose acetate hydrogen phthalate, cellulose acetate, cellulose acetate propionate, cellulose 45 acetate butyrate, cellulose triacetate; a polycarbonate; poly(styrene-co-acrylonitrile), a poly(sulfone) or a poly(phenylene oxide). The binder may be used at a coverage of from 0.1 to 5  $\text{cm}^2$ .

Any material can be used as the support for the donor element used with the receiver of the invention provided it is dimensionally stable and can withstand the heat of the thermal printing heads. Such materials include polyesters such as poly(ethylene terephthalate); polyamides; polycarbonates; glassine paper; condenser paper; cellulose esters such as cellulose acetate; fluorine polymers such as polyvinylidene fluoride or poly(tetrafluoroethylene-co-hexafluoropropylene); polyethers such as polyoxymethylene; polyacetals; polyolefins such as polystyrene, polyethylene, polypropylene or methylpentene polymers; and polyimides such as polyimide-amides and polyether-imides. The support generally has a thickness of from 2 to 30  $\mu\text{m}$ . It may also be coated with a subbing layer, if desired.

55 When using the donor element of the invention with a resistive head, the reverse side of the donor element is coated with a slipping layer to prevent the printing head from sticking to the donor element. Such a slipping layer would comprise a lubricating material such as a surface active agent, a liquid lubricant, a solid lubricant or mixtures thereof, with or without a polymeric binder.

The receiving element of the invention comprises a support having thereon an image-receiving layer and

the ligand described above. The support may be a transparent film such as poly(ethylene terephthalate) or reflective.

The image-receiving layer may comprise, for example, a polycarbonate, a polyurethane, a polyester, polyvinyl chloride, poly(styrene-co-acrylonitrile), poly(caprolactone) or mixtures thereof.

As noted above, the donor elements employed in the invention are used to form a transfer image. Such a process comprises a) imagewise-heating a donor element comprising a support having on one side thereof a layer comprising a material dispersed in a polymeric binder, and on the other side thereof a slipping layer comprising a lubricant, and b) transferring an image to a receiving element comprising a support having thereon an image-receiving layer to form the transfer image, and wherein the material is a 6-coordinate europium(III) complex and the image-receiving layer also contains an uncharged monodentate or bidentate ligand capable of reacting with the 6-coordinate europium(III) complex to form a higher coordinate complex as described above.

The donor element employed in the invention may be used in sheet form or in a continuous roll or ribbon. If a continuous roll or ribbon is employed, it may have only the fluorescent europium complex thereon as described above, with or without an image dye, or may have alternating areas of different dyes, such as sublimable magenta and/or yellow and/or cyan and/or black or other dyes.

If a laser is used to transfer dye from the dye-donor employed in the invention to the receiver, then an absorbent material is used in the dye-donor. Any material that absorbs the laser energy may be used such as carbon black or non-volatile infrared-absorbing dyes or pigments which are well known to those skilled in the art.

A thermal transfer assemblage of the invention comprises

a) a donor element as described above, and

b) a receiving element as described above, the receiving element being in a superposed relationship with the donor element so that the fluorescent material layer of the donor element is in contact with the image-receiving layer of the receiving element.

The following example is provided to illustrate the invention.

#### Example 1

This example shows the enhanced fluorescence obtained by transferring 6-coordinate europium complexes from a donor to a receiver containing an auxiliary ligand.

A donor element was prepared by coating the following layers in the order recited on a 6  $\mu$ m poly(ethylene terephthalate) support:

- 1) a subbing layer of duPont Tyzor TBT® titanium tetra-n-butoxide (0.12 g/m<sup>2</sup>) from 1-butanol; and
- 2) a layer containing the 6-coordinate europium fluorescent complex with the diketone ligand, as identified above (0.38 g/m<sup>2</sup>) or comparison material identified below (0.16 g/m<sup>2</sup>) in a cellulose acetate butyrate 17% acetyl and 28% butyryl binder (0.43 g/m<sup>2</sup> or control at 0.32 g/m<sup>2</sup>) coated from a cyclopentanone, toluene and methanol solvent mixture.

On the back side of the donor-element was coated:

- 1) a subbing layer of duPont Tyzor TBT® titanium tetra-n-butoxide (0.12 g/m<sup>2</sup>) from 1-butanol; and
- 2) a slipping layer of Emralon 329® polytetrafluoroethylene dry film lubricant (Acheson Colloids) (0.54 g/m<sup>2</sup>) and S-Naubax 5021 Carnauba Wax (Shamrock Technology) (0.003 g/m<sup>2</sup>) coated from a n-propyl acetate, toluene, 2-propanol and 1-butanol solvent mixture.

A receiving element was prepared by coating a solution of Makrolon 5700® (Bayer A.G. Corporation) a bisphenol-A polycarbonate resin (2.9 g/m<sup>2</sup>), the auxiliary ligand indicated above (0.38 g/m<sup>2</sup>) or control material (0.38 g/m<sup>2</sup>) indicated below, and FC-431® surfactant (3M Corporation) (0.16 g/m<sup>2</sup>) in a methylene chloride and trichloroethylene solvent mixture on a transparent 175  $\mu$ m polyethylene terephthalate support subbed with a layer of poly(acrylonitrile-co-vinylidene chloride-co-acrylic acid) (14:79:7 wt ratio) (0.005 g/m<sup>2</sup>).

The following control material, lacking coordinating atoms, which was coated in a receiver, is available commercially from Kodak Laboratory Products and Chemicals Division.

Biphenyl

The fluorescent material layer side of the donor element strip approximately 9 cm x 12 cm in area was

placed in contact with the image-receiving layer of a receiver element of the same area. The assemblage was fastened in the jaws of a stepper motor driven pulling device. The assemblage was laid on top of a 14 mm diameter rubber roller and a TDK Thermal Head L-133 (No. 6-2R16-1) was pressed with a spring at a force of 36 N against the donor element side of the contacted pair pushing it against the rubber roller.

The imaging electronics were activated causing the pulling device to draw the assemblage between the printing head and roller at 3.1 mm/sec. Coincidentally the resistive elements in the thermal print head were pulsed at a per pixel pulse width of 8 msec to generate a maximum density image. The voltage supplied to the print-head was approximately 25 v representing approximately 1.6 watts/dot (13. mJoules/dot).

The receiving element was separated from the donor element and the relative emission was evaluated with a spectrofluorimeter using a fixed intensity 360 nm excitation beam and measuring the relative area under the emission spectrum from 375 to 700 nm. The following results were obtained (all transferred materials emitted between 610 and 625 nm.):

Table 1

	<u>Complex in Donor</u>	<u>Auxiliary Ligand in Receiver</u>	<u>Relative Emission*</u>	<u>Visual Color</u>
5				
10	None	None	<1	Not visible
	Comparison*	None	100	Blue
15	Compound 1	2,2'-Bipyridine	42	Intense red
	Compound 1	1,10-Phenanthroline	42	Intense red
20	Compound 1	Ethylene diamine	51	Intense red
	Compound 1	Trioctylphosphine oxide	35	Intense red
25	Compound 1	Biphenyl (control)	5	Moderate red
30	Compound 1	None (control)	5	Moderate red
	Compound 2	2,2'-Bipyridine	35	Intense red
35	Compound 2	Biphenyl (control)	5	Moderate red
	Compound 2	None (control)	5	Moderate red
40	Compound 3	2,2'-Bipyridine	11	Red
	Compound 3	Biphenyl (control)	1	Faint red
	Compound 3	None (control)	1	Faint red
50	Compound 4	2,2'-Bipyridine	7	Red
	Compound 4	None (control)	3	Moderate red

55

Table 1 (continued)

Complex in Donor	Auxiliary Ligand in Receiver	Relative Emission*	Visual Color
Compound 5	2,2'-Bipyridine	2	Moderate red
Compound 5	None (control)	1	Faint red

\* Compared to the following compound, normalized to 100 (emission between 400-500 nm).

This compound is the subject of U.S. Patent 4,876,237.

The above results show that using an auxiliary ligand in the receiver in accordance with the invention to coordinate with the fluorescent materials supplied by a donor has much more fluorescence than the control or comparison compounds.

### Claims

1. A receiving element for thermal transfer comprising a support having thereon a polymeric image-receiving layer, characterized in that said image-receiving layer also contains an image comprising a coordinate complex having the formula:

wherein: D is a substituted or unsubstituted, aromatic, 5- or 6-membered carbocyclic or heterocyclic moiety;  
J is  $-\text{CF}_3$ ,  $-\text{CH}_3$ ,  $-\text{CH}_2\text{F}$  or  $-\text{CHF}_2$ ; and  
B represents at least one monodentate ligand with an electron-donating oxygen or nitrogen atom or at least one bidentate ligand with two electron-donating oxygen, nitrogen or sulfur atoms capable of forming a 5- or 6-membered ring with the europium atom.

2. The element of Claim 1 characterized in that B represents tri-n-octylphosphine oxide, pyridine-N-oxide or triphenylphosphine oxide.

3. The element of Claim 1 characterized in that B represents 2,2'-bipyridine, 1,10-phenanthroline, ethylene diamine or 1,2-diaminobutane.

4. The element of Claim 1 characterized in that D represents phenyl, 2-thienyl, 2-furyl or 3-pyridyl.

5. A process of forming a transfer image comprising :

- a) imagewise-heating a donor element comprising a support having on one side thereof a layer comprising a material dispersed in a polymeric binder, and  
b) transferring an image to a receiving element comprising a support having thereon an image-receiving layer to form said transfer image,

characterized in that said material is a 6-coordinate europium(III) complex and said image-receiving layer also contains a monodentate or bidentate ligand capable of reacting with said 6-coordinate europium(III) complex to form a higher coordinate complex, said 6-coordinate europium(III) complex having the formula:

wherein: D is a substituted or unsubstituted, aromatic, 5- or 6-membered carbocyclic or heterocyclic moiety; and  
J is  $-\text{CF}_3$ ,  $-\text{CH}_3$ ,  $-\text{CH}_2\text{F}$  or  $-\text{CHF}_2$ .

6. The process of Claim 5 characterized in that said higher coordinate complex has the formula:

wherein: D is a substituted or unsubstituted, aromatic, 5- or 6-membered carbocyclic or heterocyclic moiety;  
J is  $-\text{CF}_3$ ,  $-\text{CH}_3$ ,  $-\text{CH}_2\text{F}$  or  $-\text{CHF}_2$ ; and  
B represents at least one monodentate ligand with an electron-donating oxygen or nitrogen atom or at least one bidentate ligand with two electron-donating oxygen, nitrogen or sulfur atoms capable of forming a 5- or 6-membered ring with the europium atom.

7. A thermal transfer assemblage comprising:

- a) a donor element comprising a support having on one side thereof a layer comprising a material dispersed in a polymeric binder, and  
b) a receiving element comprising a support having thereon an image-receiving layer, said receiving element being in a superposed relationship with said donor element so that said material layer is in contact with said image-receiving layer, the improvement wherein said material is a 6-coordinate europium(III) complex and said image-receiving layer also contains a monodentate or bidentate ligand capable of reacting with said 6-coordinate europium(III) complex to form a higher coordinate complex, said 6-coordinate europium(III) complex having the formula:

wherein: D is a substituted or unsubstituted, aromatic, 5- or 6-membered carbocyclic or heterocyclic moiety; and  
J is  $-\text{CF}_3$ ,  $-\text{CH}_3$ ,  $-\text{CH}_2\text{F}$  or  $-\text{CHF}_2$ .

8. The assemblage of Claim 7 characterized in that D represents phenyl, 2-thienyl, 2-furyl or 3-pyridyl.
9. The assemblage of Claim 7 characterized in that said higher coordinate complex has the formula:

wherein: D is a substituted or unsubstituted, aromatic, 5- or 6-membered carbocyclic or heterocyclic moiety;  
J is  $-\text{CF}_3$ ,  $-\text{CH}_3$ ,  $-\text{CH}_2\text{F}$  or  $-\text{CHF}_2$ ; and  
B represents at least one monodentate ligand with an electron-donating oxygen or nitrogen atom or at least one bidentate ligand with two electron-donating oxygen, nitrogen or sulfur atoms capable of forming a 5- or 6-membered ring with the europium atom.

10. The assemblage of Claim 9 characterized in that B represents tri-n-octylphosphine oxide, pyridine-N-oxide, triphenylphosphine oxide, 2,2'-bipyridine, 1,10-phenanthroline, ethylene diamine or 1,2-diaminobutane; and D represents phenyl, 2-thienyl, 2-furyl or 3-pyridyl.

#### Patentansprüche

1. Empfangselement für die thermische Übertragung mit einem Träger, auf dem sich eine polymere Bild-Empfangsschicht befindet, dadurch gekennzeichnet, daß die Bild-Empfangsschicht auch ein Bild mit einem Koordinations-Komplex der folgenden Formel enthält:

worin bedeuten: D einen substituierten oder unsubstituierten, aromatischen, 5- oder 6-gliedrigen carbocyclischen oder heterocyclischen Rest;  
J einen Rest der Formeln  $-\text{CF}_3$ ,  $-\text{CH}_3$ ,  $-\text{CH}_2\text{F}$  oder  $-\text{CHF}_2$ ; und  
B mindestens einen Monodentat-Liganden mit einem elektronenspendenden Sauerstoff- oder Stickstoffatom oder mindestens einen Bidentat-Liganden mit zwei elektronenspendenden Sauerstoff-, Stickstoff-

oder Schwefelatomen, die dazu befähigt sind, einen 5- oder 6-gliedrigen Ring mit dem Europiumatom zu bilden.

- 5 2. Element nach Anspruch 1, dadurch gekennzeichnet, daß B darstellt Tri-n-octylphosphinoxid, Pyridin-N-oxid oder Tri-phenylphosphinoxid.
3. Element nach Anspruch 1, dadurch gekennzeichnet, daß B darstellt 2,2'-Bipyridin, 1,10-Phenanthrolin, Ethylendiamin oder 1,2-Diaminobutan.
- 10 4. Element nach Anspruch 1, dadurch gekennzeichnet, daß D darstellt Phenyl, 2-Thienyl, 2-Furyl oder 3-Pyridyl.
5. Verfahren zur Herstellung eines Übertragungsbildes, bei dem man:
  - 15 a) ein Donorelement mit einem Träger, auf dessen einer Seite sich eine Schicht mit einem Material, dispergiert in einem polymeren Bindemittel, befindet, bildweise erhitzt und bei dem man
  - b) ein Bild auf ein Empfangselement überträgt, das einen Träger aufweist, auf dem sich eine Bild-Empfangsschicht befindet, unter Erzeugung des Übertragungsbildes,
 dadurch gekennzeichnet, daß das Material ein 6-koordinierter Europium (III)-Komplex ist, und daß die Bild-Empfangsschicht ferner einen Monodentat- oder Bidentat-Liganden enthält, der dazu befähigt ist, mit dem 6-koordinierten Europium-(III)-Komplex einen höher koordinierten Komplex zu bilden, wobei der 6-koordinierte Europium (III)-Komplex der folgenden Formel entspricht:

worin bedeuten: D einen substituierten oder unsubstituierten, aromatischen, 5- oder 6-gliedrigen carbocyclischen oder heterocyclischen Rest; und J einen Rest der Formeln -CF<sub>3</sub>, -CH<sub>3</sub>, -CH<sub>2</sub>F oder -CHF<sub>2</sub>.

6. Verfahren nach Anspruch 5, dadurch gekennzeichnet, daß der höher koordinierte Komplex der folgenden Formel entspricht:

worin bedeuten: D einen substituierten oder unsubstituierten, aromatischen, 5- oder 6-gliedrigen carbocyclischen oder heterocyclischen Rest;

J einen Rest der Formeln -CF<sub>3</sub>, -CH<sub>3</sub>, -CH<sub>2</sub>F oder -CHF<sub>2</sub>; und

B mindestens einen Monodentat-Liganden mit einem elektronenspendenden Sauerstoff- oder Stickstoffatom oder mindestens einen Bidentat-Liganden mit zwei elektronenspendenden Sauerstoff-, Stickstoff- oder Schwefelatomen, die dazu befähigt sind, einen 5- oder 6-gliedrigen Ring mit dem Europiumatom zu bilden.

7. Zusammenstellung für die thermische Übertragung mit:
  - a) einem Donorelement mit einem Träger, auf dessen einer Seite sich eine Schicht mit einem Material befindet, das in einem polymeren Bindemittel dispergiert ist, und
  - b) einem Empfangselement mit einem Träger, auf dem sich eine Bild-Empfangsschicht befindet,

wobei sich das Empfangselement in einer Position über dem Donorelement befindet, derart, daß die Materialschicht sich in Kontakt mit der Bild-Empfangsschicht befindet, mit der Verbesserung, daß das Material ein 6-koordinierter Europium-(III)-Komplex ist, und daß die Bild-Empfangsschicht ferner enthält einen Monodentat- oder Bidentat-Liganden, der mit dem 6-koordinierten Europium (III)-Komplex unter Bildung eines höher koordinierten Komplexes zu reagieren vermag, wobei der 6-koordinierte Europium (III)-Komplex der folgenden Formel entspricht:

worin bedeuten: D einen substituierten oder unsubstituierten, aromatischen, 5- oder 6-gliedrigen carbocyclischen oder heterocyclischen Rest; und  
J einen Rest der Formeln  $-\text{CF}_3$ ,  $-\text{CH}_3$ ,  $-\text{CH}_2\text{F}$  oder  $-\text{CHF}_2$ .

8. Zusammenstellung nach Anspruch 7, dadurch gekennzeichnet, daß D steht für Phenyl, 2-Thienyl, 2-Furyl oder 3-Pyridyl.
9. Zusammenstellung nach Anspruch 7, dadurch gekennzeichnet, daß der höher koordinierte Komplex der folgenden Formel entspricht:

worin bedeuten: D einen substituierten oder unsubstituierten, aromatischen, 5- oder 6-gliedrigen carbocyclischen oder heterocyclischen Rest;  
J einen Rest der Formeln  $-\text{CF}_3$ ,  $-\text{CH}_3$ ,  $-\text{CH}_2\text{F}$  oder  $-\text{CHF}_2$ ; und  
B mindestens einen Monodentat-Liganden mit einem elektronenspendenden Sauerstoff- oder Stickstoffatom oder mindestens einen Bidentat-Liganden mit zwei elektronenspendenden Sauerstoff-, Stickstoff- oder Schwefelatomen, die dazu befähigt sind, einen 5- oder 6-gliedrigen Ring mit dem Europiumatom zu bilden.

10. Zusammenstellung nach Anspruch 9, dadurch gekennzeichnet, daß B darstellt Tri-n-octylphosphinoxid; Pyridin-N-oxid; Triphenylphosphinoxid; 2,2'-Bipyridin; 1,10-Phenanthrolin; Ethylendiamin oder 1,2-Diaminobutan; und D darstellt Phenyl, 2-Thienyl, 2-Furyl oder 3-Pyridyl.

## Revendications

1. Élément récepteur pour transfert par la chaleur comprenant un support recouvert d'une couche polymère réceptrice d'image, caractérisé en ce que la couche réceptrice d'image contient aussi une image comprenant un complexe coordonné de formule :

où

D est un aromatique substitué ou non, un groupe hétérocyclique ou carbocyclique à 5 ou 6 chaînons ;

J est  $-\text{CF}_3$ ,  $-\text{CH}_3$ ,  $-\text{CH}_2\text{F}$  ou  $-\text{CHF}_2$  ; et

B représente au moins un ligand monodentate avec un atome d'oxygène ou d'azote donneur d'électron ou au moins un ligand bidentate avec deux atomes d'oxygène, d'azote ou de soufre donneurs d'électrons capables de former un cycle à 5 ou 6 chaînons avec l'atome d'euprium.

2. Élément selon la revendication 1 caractérisé en ce que B représente l'oxyde de tri-n-octylphosphine, l'oxyde de N-pyridine ou l'oxyde de triphénylphosphine.
3. Élément selon la revendication 1 caractérisé en ce que B représente la 2,2'-bipyridine, la 1,10-phé-nanthroline, l'éthylène diamine ou le 1,2-diaminobutane.
4. Élément selon la revendication 1 caractérisé en ce que D représente phényle, 2-thiényle, 2-furyle ou 3-pyridyle.
5. Procédé pour former une image par transfert dans lequel
  - a) on chauffe en conformité avec l'image un élément donneur de colorant comprenant un support recouvert sur une de ses faces par une couche comprenant une substance dispersée dans un liant polymère, et
  - b) on transfère une image sur un élément récepteur comprenant un support recouvert d'une couche réceptrice d'image pour former l'image par transfert,
 caractérisé en ce que la substance est un complexe à coordination 6 de l'euprium (III) et la couche réceptrice d'image contient aussi un ligand monodentate ou bidentate capable de réagir avec le complexe à coordination 6 de l'euprium (III) pour former un complexe à degré de coordination plus élevé, le complexe à coordination 6 de l'euprium III ayant la formule :

où

D est un aromatique substitué ou non, un groupe carbocyclique ou hétérocyclique à 5 ou 6 chaînons ; et

J est  $-\text{CF}_3$ ,  $-\text{CH}_3$ ,  $-\text{CH}_2\text{F}$  ou  $-\text{CHF}_2$ .

6. Procédé selon la revendication 5 caractérisé en ce que le complexe à degré de coordination plus élevé à la formule :

où

D est un aromatique substitué ou non, un groupe hétérocyclique ou carbocyclique à 5 ou 6 chaînons ;

J est  $-\text{CF}_3$ ,  $-\text{CH}_3$ ,  $-\text{CH}_2\text{F}$  ou  $-\text{CHF}_2$  ; et

B représente au moins un ligand monodentate avec un atome d'oxygène ou d'azote donneur d'électron ou au moins un ligand bidentate avec deux atomes d'oxygène, d'azote ou de soufre donneurs d'électrons capables de former un cycle à 5 ou 6 chaînons avec l'atome d'euprium.

7. Assemblage pour transfert de colorant comprenant

a) un élément donneur comprenant un support recouvert sur une de ses faces par une couche comprenant une substance dispersée dans un liant polymère, et

b) un élément récepteur comprenant un support recouvert d'une couche réceptrice d'image, l'élément récepteur et l'élément donneur étant superposés pour que la couche de substance soit en contact avec la couche réceptrice d'image, caractérisé en ce que la substance est un complexe à coordination 6 de l'euprium (III) et la couche réceptrice d'image contient aussi un ligand monodentate ou bidentate capable de réagir avec le complexe à coordination 6 de l'euprium (III) pour former un complexe à degré de coordination plus élevé, le complexe à coordination 6 de l'euprium III ayant la formule :

où

D est un aromatique substitué ou non, un groupe carbocyclique ou hétérocyclique à 5 ou 6 chaînons ; et

J est  $-\text{CF}_3$ ,  $-\text{CH}_3$ ,  $-\text{CH}_2\text{F}$  ou  $-\text{CHF}_2$ .

8. Assemblage selon la revendication 7 dans lequel D représente phényle, 2-thiényle, 2-furyle ou 3-pyridyle.

9. Assemblage selon la revendication 7 dans lequel le complexe à degré de coordination plus élevé à la formule :

où

D est un aromatique substitué ou non, un groupe hétérocyclique ou carbocyclique à 5 ou 6 chaînons ;

nons ;

J est  $-\text{CF}_3$ ,  $-\text{CH}_3$ ,  $-\text{CH}_2\text{F}$  ou  $-\text{CHF}_2$  ; et

B représente au moins un ligand monodentate avec un atome d'oxygène ou d'azote donneur d'électron ou au moins un ligand bidentate avec deux atomes d'oxygène, d'azote ou de soufre donneurs d'électrons capables de former un cycle à 5 ou 6 chaînons avec l'atome d'euprium.

10. Assemblage selon la revendication 7 dans lequel B représente l'oxyde de tri-n-octylphosphine, l'oxyde de N-pyridine ou l'oxyde de triphénylphosphine, la 2,2'-bipyridine, la 1,10-phénanthroline, l'éthylène diamine ou le 1,2-diaminobutane, et D représente phényle, 2-thiényle, 2-furyle ou 3-pyridyle.
